## Intermediate SQL

Joseph Hallett

February 13, 2023

#### Last time...

We introduced SQL as a language for querying databases

- ► How to create tables
- ► How to add and delete data
- ► How to run basic queries

#### This time...

More advanced SQL!

- ► More features, more function
- ► Other joins
- ► NULL

# NULL is nothing

There is a special value in SQL to represent missing data: NULL.

- ▶ But they're pretty much always a bad idea
- ► The logic for comparing them is pretty whacky

#### NULL = NULL?

Lets say we have a database with the following table:

Person Fruit Joseph Lime Matt Apple Partha Lets find everyone who we know what their favourite fruit is!

SELECT \* FROM fruit WHERE fruit <> NULL;

Err..., lets try the opposite?

SELECT \* FROM fruit WHERE fruit = NULL;

Err what?

SELECT \* FROM fruit WHERE fruit LIKE '%';

Person Fruit Joseph Lime Matt Apple

So...

SELECT \* FROM fruit WHERE fruit NOT LIKE '%';

#### NULL is weird...

Because NULL means attribute missing...

► The results of comparing with it are just plain stupid somewhat unexpected The simple solution is to declare everything as NOT NULL

► And use a higher normal form (5NF) then you'll find they almost entirely disappear Otherwise you have to memorise a bunch of stupid special comparators

SELECT \* FROM fruit WHERE fruit IS NULL;

Person Fruit Partha

SELECT \* FROM fruit WHERE fruit IS NOT NULL;

Person Fruit Joseph Lime Matt Apple

# Tricky joins

Clearly testing for equality when NULL is problematic.

▶ So what happens when you want to join two tables together with NULL's in them

Person	Fruit	Fruit	Dish
Joseph	Lime	Apple	Apple crumble
Matt	Apple	Banana	Banana split
Partha	• •	Cherry	-
		Lime	Daiquiri

### What's my favourite food?

So what might make a nice dish for each of your lecturers?

► (A NATURAL JOIN is like a regular JOIN but assumes same named columns ought to be equal).

Person Fruit Dish Joseph Lime Daiquiri Matt Apple Apple crumble

But what about poor Partha? How do we get him to appear in our table?

#### LEFT and RIGHT JOIN

When doing our previous JOIN we wanted only rows that matched...

► Technically called an INNER JOIN...

Sometimes we're okay with the database sticking NULL in if we want to keep columns where a join *can't* be made...

```
SELECT person, fruit.fruit, dish
FROM fruit
LEFT JOIN recipes
ON fruit.fruit = recipes.fruit;
```

```
Person Fruit Dish
Joseph Lime Daiquiri
Matt Apple Apple crumble
Partha
```

#### RIGHT JOIN

A RIGHT JOIN is like a left join but the other way round...

SELECT fruit.fruit, dish, person FROM fruit RIGHT JOIN recipes ON fruit.fruit = recipes.fruit;

> Fruit Dish Person Lime Daiguiri Joseph Apple crumble Matt Apple Banana split

Where has the Banana gone?!

SELECT recipes.fruit, dish, person FROM fruit RIGHT JOIN recipes ON fruit.fruit = recipes.fruit;

> Fruit Dish Person Lime Daiguiri Joseph Apple crumble Matt Apple Banana split Banana Cherry

(Or just NATURAL JOIN and it'll usually take care of it...)

SELECT fruit, dish, person FROM fruit RIGHT NATURAL JOIN recipes:

> Fruit Lime Apple Banana Cherry

Dish Daiguiri Apple crumble Matt Banana split

Person Joseph

4 D > 4 D > 4 E > 4 E > E 900

#### One more JOIN!

What if we want to do a LEFT and a RIGHT JOIN at the same time?

SFLECT \* FROM fruit FULL OUTER NATURAL JOIN recipes;

> Person Fruit Dish Daiquiri Joseph Lime Matt Apple Apple crumble Partha Banana split Banana

#### What about statistic functions?

In the last lecture we introduced COUNT as a way of counting how many things exist?

► How may different fruits are in the outer joined table?

SELECT \* SELECT COUNT(fruit) FROM fruit FROM fruit FULL OUTER NATURAL JOIN recipes; FULL OUTER NATURAL JOIN recipes Person Fruit Dish COUNT(fruit) Joseph Lime Daiguiri Matt Apple Apple crumble ...So it looks like COUNT ignores NULL Partha Banana split Banana Cherry

#### Other statistics...

#### Lets rank fruits!

Fruit	Stars
Apple	0
Banana	4
Cherry	
Lime	5

SELECT AVG(stars) AS Average FROM ranking;

Average 3.0

SELECT SUM(stars)/COUNT(fruit) AS Average
FROM ranking;

Average 2

Remember computers are awful

- ► Multiply count by 1.0 to "fix"?
- ► Also number of stars is *ordinal* data so the *mean* shouldn't be used anyway...

### What about standard deviation?

The standard deviation is how far something deviates on average from the mean.

```
SELECT SQRT(AVG(Deviation)) AS STDDEV
FROM (
    SELECT Fruit, Stars, Mean,
        (Stars-Mean)*(Stars-Mean) AS Deviation
    FROM ranking JOIN (
        SELECT AVG(stars) AS Mean
        FROM ranking
    )
    WHERE stars IS NOT NULL
);
```

STDDEV 2.16024689946929

You can nest queries inside one another (subqueries!)

- ▶ This is a recipe for making your SQL slow
- Maybe just use SQL for data retrieval and leave complex stats to statistical programming languages?

## So thats SQL!

### Tips for using it?

- ► Don't overcomplicate things!
- ▶ Normal forms make things simpler!
- ► Avoid NULL like the plague
